

City Walk Route Guide: Visualizing Urban Exploration for Young Tourists in Shanghai

By: Yuyang Guo, Yufei Chen

Abstraction

This project proposes an interactive "City Walk Route Guide" for young tourists with limited leisure time, focusing on short trips, city landscapes, and entertainment consumption. It initially targets five famous streets in Shanghai (Yuyuan Road, Anfu Road, Wukang Road, People's Square, Huaihai Road). By integrating multi-dimensional visual data (photos, descriptions, and social media comments) on Google Maps, it provides users with enhanced referencability for urban exploration, avoids unpleasant experiences of wasted time, promotes critical reflection on "internet celebrity culture," and aligns with SDG 12 (Responsible Consumption)

Target groups and issues

- **Target audience:** Young tourists and residents in Shanghai with limited time and budget, who actively participate in "internet celebrity" consumer culture and rely on social media for travel decisions.
- **Core issue:** Severe information asymmetry, leading to disappointing experiences such as idealized online performances, high prices (e.g., 50 yuan coffee), over-commercialized spaces, and reality gaps compared to social media images.

Methodology

- **Data:** Official open data+social media content+user crowdsourcing
- **Technical stack:** Google Maps API+HTML/CSS/JS+Python data processing
- **Interaction:** map tagging, tag filtering, detail pop ups, route suggestions, photography guide

Innovation

- **Micro visualization:** Using social media data for street level experiential decision-making

- **Critical Design:** Revealing the Gap between Internet Celebrity Marketing and Reality

- **Community driven:** Integrating User Generated Content and Consumer Transparency

Core Value

Information Transparency:

Integrating authentic evaluations, price ranges, and spatial characteristics to break down false marketing

Experience planning:

supports tag filtering, route recommendations, and photography guides to enhance exploration efficiency

Sustainable guidance: promoting rational consumption, reducing resource waste, and advancing SDG 3&11&12 construction

Technical Implement

- Front end: HTML, Python+Google Maps Amap web API for interactive mapping
- Data processing: Python preprocessing of Excel datasets → JSON → dynamic rendering
- Interactive function: Filterable markers, InfoWindows with images/descriptions/reviews, sidebar modules (photography guidance, feedback form, public transport recommendations).

Data source

- **Official Open Data:** Verified information from Shanghai Municipal Administration of Culture and Tourism.
- **Core Data:** Manually collected store information from social media (excluding official marketing content), including attributes, space assessment, and consumption level.
- **Future Expansion:** User crowdsourcing for continuous updates.

“A map that reveals the real experiences and consumption traps of internet famous neighborhoods.”

SDG GOAL 3&11&12

This InfoVis project is for submission to INFOSCI 301 Data Visualization and Information Aesthetics Spring 2026, instructed by Professor Luyao Zhang at Duke Kunshan University. We thank our professor, peer classmates, and community partners , including the Jiading District Urban Planning Exhibition Hall, the Fengxian Waving Cube Sci-Fi Immersive Museum, and the Kunshan Museum of Chinese Opera Genres (Kunqu Opera Living Heritage) , for their contributions to this project. We also extend our gratitude to industry contributors for their valuable insights.
